# Geography Game

**Geography.** Amy names capital city  $c$  of country she is in. Bob names a capital city  $c'$  that starts with the letter on which  $c$  ends. Amy and Bob repeat this game until one player is unable to continue. Does Amy have a forced win?

**Ex.** Budapest  $\rightarrow$  Tokyo  $\rightarrow$  Ottawa  $\rightarrow$  Ankara  $\rightarrow$  Amsterdam  $\rightarrow$  Moscow  $\rightarrow$  Washington  $\rightarrow$  Nairobi  $\rightarrow$  ...

**Geography on graphs.** Given a directed graph  $G = (V, E)$  and a start node  $s$ , two players alternate turns by following, if possible, an edge out of the current node to an unvisited node. Can first player guarantee to make the last legal move?

**Remark.** Some problems (especially involving 2-player games and AI) defy classification according to P, NP, and NP-complete.

# 9.1 PSPACE

---

# PSPACE

**P.** Decision problems solvable in polynomial **time**.

**PSPACE.** Decision problems solvable in polynomial **space**.

**Observation.**  $P \subseteq PSPACE$ .

↑  
poly-time algorithm can consume only polynomial space

# PSPACE

Claim. 3-SAT is in PSPACE.

Pf.

- Enumerate all  $2^n$  possible truth assignments.
- Check each assignment to see if it satisfies all clauses. ▪

Theorem.  $NP \subseteq PSPACE$ .

Pf. Consider arbitrary problem  $Y$  in NP.

- Since  $Y \leq_p 3\text{-SAT}$ , there exists algorithm that solves  $Y$  in poly-time plus polynomial number of calls to 3-SAT black box.
- Can implement black box in poly-space. ▪

## 9.3 Quantified Satisfiability

---

# Quantified Satisfiability

**QSAT (Quantified 3-SAT).** Let  $\Phi(x_1, \dots, x_n)$  be a Boolean CNF formula. Is the following propositional formula true?

$$\exists x_1 \forall x_2 \exists x_3 \forall x_4 \dots \forall x_{n-1} \exists x_n \Phi(x_1, \dots, x_n)$$

↑  
assume n is odd

**Intuition.** Amy picks truth value for  $x_1$ , then Bob for  $x_2$ , then Amy for  $x_3$ , and so on. Can Amy satisfy  $\Phi$  no matter what Bob does?

**Ex.**  $(x_1 \vee x_2) \wedge (x_2 \vee \overline{x_3}) \wedge (\overline{x_1} \vee \overline{x_2} \vee x_3)$

**Yes.** Amy sets  $x_1$  true; Bob sets  $x_2$ ; Amy sets  $x_3$  to be same as  $x_2$ .

**Ex.**  $(x_1 \vee x_2) \wedge (\overline{x_2} \vee \overline{x_3}) \wedge (\overline{x_1} \vee \overline{x_2} \vee x_3)$

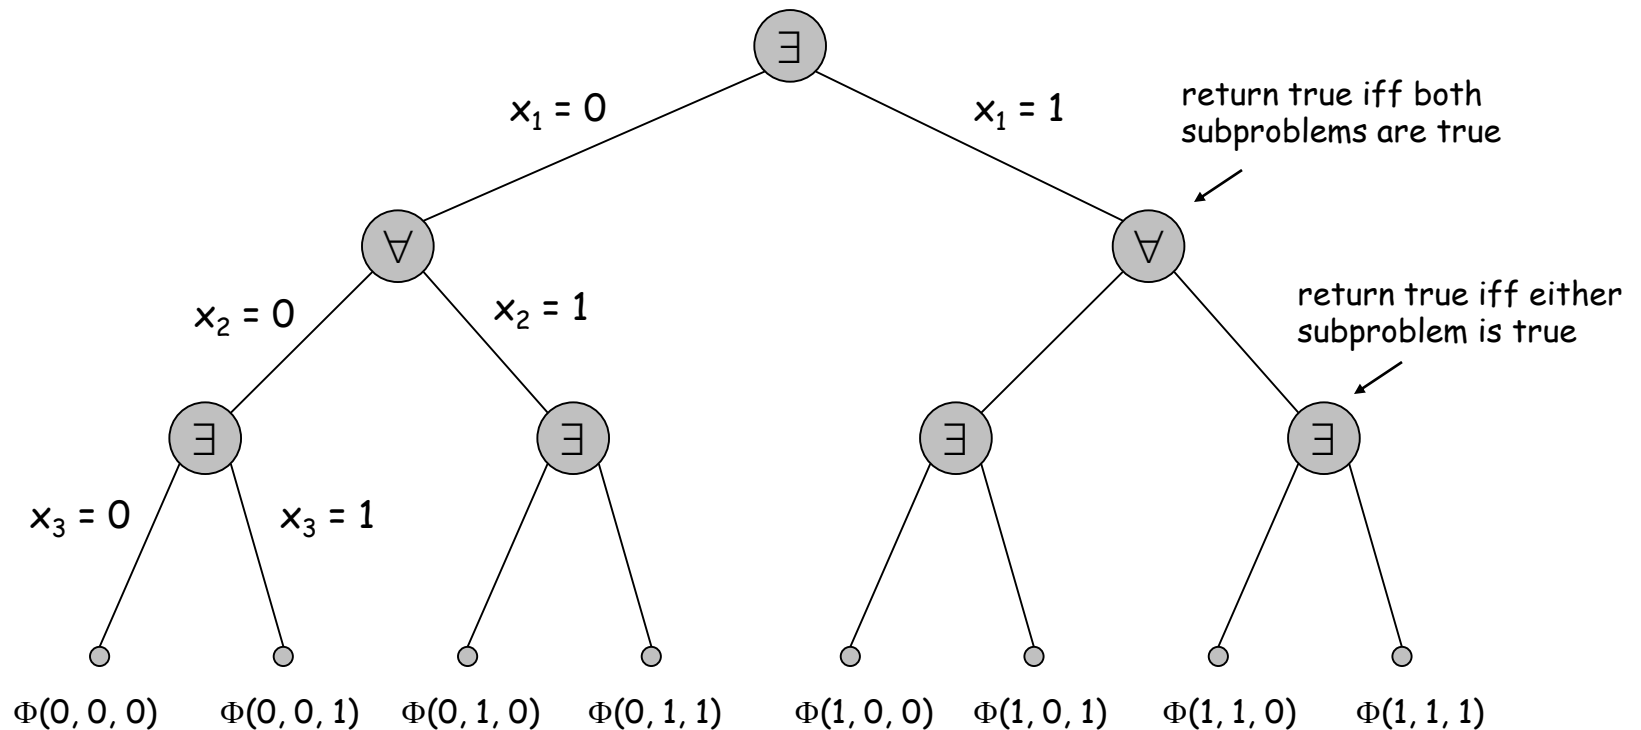

**No.** If Amy sets  $x_1$  false; Bob sets  $x_2$  false; Amy loses;  
if Amy sets  $x_1$  true; Bob sets  $x_2$  true; Amy loses.

# QSAT is in PSPACE

**Theorem.**  $\text{QSAT} \in \text{PSPACE}$ .

**Pf.** Recursively try all possibilities.

- Only need one bit of information from each subproblem.
- Amount of space is proportional to depth of function call stack.

## 9.4 Planning Problem

---

# 15-Puzzle

8-puzzle, 15-puzzle. [Sam Loyd 1870s]

- Board: 3-by-3 grid of tiles labeled 1-8.
- Legal move: slide neighboring tile into blank (white) square.
- Find sequence of legal moves to transform initial configuration into goal configuration.

# Planning Problem

**Conditions.** Set  $C = \{ C_1, \dots, C_n \}$ .

**Initial configuration.** Subset  $c_0 \subseteq C$  of conditions initially satisfied.

**Goal configuration.** Subset  $c^* \subseteq C$  of conditions we seek to satisfy.

**Operators.** Set  $O = \{ O_1, \dots, O_k \}$ .

- To invoke operator  $O_i$ , must satisfy certain prereq conditions.
- After invoking  $O_i$  certain conditions become true, and certain conditions become false.

**PLANNING.** Is it possible to apply sequence of operators to get from initial configuration to goal configuration?

**Examples.**

- 15-puzzle.
- Rubik's cube.
- Logistical operations to move people, equipment, and materials.

# Planning Problem: 8-Puzzle

Planning example. Can we solve the 8-puzzle?

Conditions.  $C_{ij}$ ,  $1 \leq i, j \leq 9$ .  $\leftarrow C_{ij}$  means tile  $i$  is in square  $j$

Initial state.  $c_0 = \{C_{11}, C_{22}, \dots, C_{66}, C_{78}, C_{87}, C_{99}\}$ .

Goal state.  $c^* = \{C_{11}, C_{22}, \dots, C_{66}, C_{77}, C_{88}, C_{99}\}$ .

Operators.

- Precondition to apply  $O_i = \{C_{11}, C_{22}, \dots, C_{66}, C_{78}, C_{87}, C_{99}\}$ .
- After invoking  $O_i$ , conditions  $C_{79}$  and  $C_{98}$  become true.
- After invoking  $O_i$ , conditions  $C_{78}$  and  $C_{99}$  become false.

1	2	3
4	5	6
8	7	9

$\downarrow O_i$

1	2	3
4	5	6
8	9	7

(This is the most straightforward cast of 8-puzzle to planning, though better cast exists.)

# Planning Problem: In Exponential Time

## Configuration graph $G$ .

- Include node for each of  $2^n$  possible configurations.
- Include an edge from configuration  $c'$  to configuration  $c''$  if one of the operators can convert from  $c'$  to  $c''$ .

**PLANNING.** Is there a path from  $c_0$  to  $c^*$  in configuration graph?

**Claim.** PLANNING is in EXPTIME.

**Pf.** Run BFS to find path from  $c_0$  to  $c^*$  in configuration graph. ▪

**Note.** Configuration graph can have  $2^n$  nodes, and shortest path can be of length  $= 2^n - 1$ .

# Planning Problem: In Polynomial Space

**Theorem.** PLANNING is in PSPACE.

**Pf.**

- Suppose there is a path from  $c_1$  to  $c_2$  of length  $\leq L$ .
- Path from  $c_1$  to midpoint and from midpoint to  $c_2$  are each  $\leq L/2$ .
- Enumerate all possible midpoints.
- Apply recursively. Depth of recursion =  $\log_2 L$ .

```
boolean hasPath( $c_1$ ,  $c_2$ , L) {  
    if (L = 1) return correct answer  
  
    foreach configuration  $c'$  {  
        boolean x = hasPath( $c_1$ ,  $c'$ , L/2)  
        boolean y = hasPath( $c'$ ,  $c_2$ , L/2)  
        if (x and y) return true  
    }  
    return false  
}
```

## 9.5 PSPACE-Complete

---

# PSPACE-Complete

**PSPACE.** Decision problems solvable in polynomial space.

**PSPACE-Complete.** Problem  $Y$  is PSPACE-complete if (i)  $Y$  is in PSPACE and (ii) for every problem  $X$  in PSPACE,  $X \leq_p Y$ .

**Theorem.** [Stockmeyer-Meyer 1973] QSAT is PSPACE-complete.

**Theorem.**  $\text{PSPACE} \subseteq \text{EXPTIME}$ .

**Pf.** Previous algorithm solves QSAT in exponential time, and QSAT is PSPACE-complete. •

**Summary.**  $P \subseteq NP \subseteq \text{PSPACE} \subseteq \text{EXPTIME}$ .

↑            ↑            ↑  
it is known that  $P \neq \text{EXPTIME}$ , but unknown which inclusion is strict;  
conjectured that all are

# PSPACE-Complete Problems

## More PSPACE-complete problems.

- **Competitive facility location.**
- Natural generalizations of games.
  - Othello, Hex, Geography, Rush-Hour, Instant Insanity
  - Shanghai, go-moku, Sokoban
- Given a memory restricted Turing machine, does it terminate in at most  $k$  steps?
- Do two regular expressions describe different languages?
- Is it possible to move and rotate complicated object with attachments through an irregularly shaped corridor?
- Is a deadlock state possible within a system of communicating processors?

# Competitive Facility Location

**Input.** Graph with positive node weights, and target number  $B$ .

**Game.** Two competing players alternate in selecting nodes. Not allowed to select a node if any of its neighbors has been selected.

**Competitive facility location.** Can second player guarantee at least  $B$  units of profit?

(In general, the graph may not be a chain.)

Yes if  $B = 20$ ; no if  $B = 25$ .

# Competitive Facility Location

**Claim.** COMPETITIVE-FACILITY is PSPACE-complete.

**Pf.**

- To solve it in poly-space, use recursion like QSAT, but at each step there are up to  $n$  choices instead of 2.

# Competitive Facility Location

**Claim.** COMPETITIVE-FACILITY is PSPACE-complete.

**Pf.**

- To show that it's complete, we show that QSAT polynomial reduces to it. Given an instance of QSAT, we construct an instance of COMPETITIVE-FACILITY such that player 2 can force a win iff QSAT formula is false.

# Competitive Facility Location

- Construction.** Given instance  $\Phi(x_1, \dots, x_n) = C_1 \wedge C_2 \wedge \dots \wedge C_k$  of QSAT. ← assume n is odd
- Include a node for each literal and its negation and connect them.
    - at most one of  $x_i$  and its negation can be chosen
  - Choose a large constant  $c$  (e.g.,  $c \geq k+2$ ), and put weight  $c^{n-i+1}$  on literal  $x_i$  and its negation;
 

set  $B = c^{n-1} + c^{n-3} + \dots + c^4 + c^2 + 1$ .

    - This ensures variables are selected in order  $x_1, x_2, \dots, x_n$ .
  - As is, player 2 will lose by 1 unit:  $c^{n-1} + c^{n-3} + \dots + c^4 + c^2$ .

# Competitive Facility Location

**Construction.** Given instance  $\Phi(x_1, \dots, x_n) = C_1 \wedge C_2 \wedge \dots \wedge C_k$  of QSAT.

- Give player 2 one last move on which she can try to win.
- For each clause  $C_j$ , add node with value 1 and an edge to each of its literals.
- Player 2 can make last move iff truth assignment defined alternately by the players failed to satisfy some clause, i.e.,

$$\forall x_1 \exists x_2 \forall x_3 \exists x_4 \dots \exists x_{n-1} \forall x_n \neg \Phi(x_1, \dots, x_n)$$

$$\Leftrightarrow \neg \exists x_1 \forall x_2 \exists x_3 \forall x_4 \dots \forall x_{n-1} \exists x_n \Phi(x_1, \dots, x_n)$$
